Damien House - CTO & VP Engineering - Capability Statement

Damien House is a fractional CTO, senior engineering advisor, and principal architect who helps organizations move from concept to production with clear architecture, governed workflows, and durable systems built to scale. Through 109.studio, he combines 20+ years of platform modernization, DevOps, Drupal architecture, and executive technical leadership with hands-on R&D in Agentic Engineering, Agent Experience (AX), retrieval-backed systems, and AI-augmented delivery. He helps founders move from prototype to production without compounding risk, and helps technical leaders introduce governed AI workflows, stronger developer systems, and modern platform foundations built to last.

Key Capabilities

- **Prototype-to-Production Architecture:** Translate rough concepts, founder intent, and AI-generated mockups into versioned specifications, technical roadmaps, and production-ready platforms that move quickly without sacrificing architectural discipline.
- **Governed Agentic Workflows:** Design explicit action surfaces, scoped permissions, retrieval-backed context, and review paths so AI can safely support meaningful work without improvising against production systems or sensitive data.
- **AI-Enabled Content Operations:** Build content governance, audit, accessibility, and metadata workflows that use AI to expand coverage, reduce manual editorial burden, and improve quality across large content estates.
- **Cloud-Native Delivery, DevEx & DevSecOps:** Modernize environments, improve CI/CD, standardize delivery workflows, and embed code quality, testing, and security checks that help teams ship faster with less rework and lower operational risk.
- **Fractional CTO Leadership & Strategic Guidance:** Provide senior technical judgment for founders and growing teams that need clarity on roadmap, architecture, sequencing, cost, and risk without the overhead of a full-time executive.

Differentiators

- **Prototype Fast, Build to Last:** Uses AI to accelerate discovery, planning, and implementation while preserving durable architecture, review discipline, and operational control.
- **Governed Intelligence:** Builds AI systems that are observable, reviewable, retrieval-backed, and integrated into real workflows.
- **Principal-Led Technical Depth:** Combines executive strategy with hands-on implementation, giving clients direct access to senior judgment from architecture through delivery.
- **Systems That Leave Teams Stronger:** Improves documentation, environments, workflows, and delivery confidence so capability remains after the engagement ends.

Value Proposition

- **Faster Delivery with Lower Technical Risk:** Help organizations move from idea to stable system quickly without compounding tech debt, governance gaps, or fragile AI integrations.
- **Better Content, Better Workflows, Better Operations:** Apply AI where it creates leverage in editorial systems, delivery pipelines, and engineering workflows while keeping humans in control of quality and outcomes.
- **A Strategic Partner for the Agentic Era:** Bring a practical framework for turning AI ambition into governed execution across products, platforms, and content operations.
